

Interactive Simulation of Patients

Medical history

Here, the students can interact with the simulated patient on the screen with an interface resembling natural language. The user types the question using free text and the system responds by playing a corresponding video sequence, in which the simulated patient (actor) gives the answer. For the in experienced user, also a menu system with preformed questions is available. Almost any medically relevant question can be used and the simulated patient can react with some "emotions", including fear, anger and irritation. A very large number of video sequenses are available , wich might be combined in real time by the system.
